Safety Precautions

1. The design of this product contains special hardware, many circuits and components specially for safety purposes. For continued protection, no changes should be made to the original design unless authorized in writing by the manufacturer. Replacement parts must be identical to those used in the original circuits. Service should be performed by qualified personnel only.
2. Alterations of the design or circuitry of the product should not be made. Any design alterations or additions will void the manufacturer's warranty and will further relieve the manufacturer of responsibility for personal injury or property damage resulting therefrom.
3. Many electrical and mechanical parts in the product have special safety-related characteristics. These characteristics are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in the parts list of Service manual. Electrical components having such features are identified by shading on the schematics and by (Δ) on the parts list in Service manual. The use of a substitute replacement which does not have the same safety characteristics as the recommended replacement part shown in the parts list in Service manual may create shock, fire, or other hazards.
4. The leads in the products are routed and dressed with ties, clamps, tubings, barriers and/or the like to be separated from live parts, high temperature parts, moving parts and/or sharp edges for the prevention of electric shock and fire hazard. When service is required, the original lead routing and dress should be observed, and they should be confirmed to be returned to normal, after reassembling.

5. Leakage current check

(Safety for electrical shock hazard)

After reassembling the product, always perform an isolation check on the exposed metal parts of the Products (antenna terminals, knobs, metal cabinet, screw heads, headphone jack, control shafts, etc.) to be sure the product is safe to operate without danger of electrical shock.

Do not use a line isolation transformer during this check.

- Plug the AC line cord directly into the AC outlet. Using a "Leakage Current Tester", measure the leakage current from each exposed metal part of the cabinet, particularly any exposed metal part having a return path to the chassis, to a known good earth ground. Any leakage current must not exceed 0.5 mA AC (r.m.s.).

● Alternate check method.

Plug the AC line cord directly into the AC outlet. Use an AC voltmeter having 1,000 ohms per volt or more sensitivity in the following manner. Connect a 1500 ohms 10W resistor paralleled by a 0.15 μ F AC-type capacitor between an exposed metal part and a known good earth ground.

Measure the AC voltage across the resistor with the AC voltmeter.

Move the resistor connection to each exposed metal part, particularly any exposed metal part having a return path to the chassis, and measure the AC voltage across the resistor. Now, reverse the plug in the AC outlet and repeat each measurement. Any voltage measured must not exceed 0.75V AC (r.m.s.).

This corresponds to 0.5 mA AC (r.m.s.).

Fig. 1

Fig. 2

Note: Set the switch to OFF, then mount or demount it holding the metal section shown above.

Service Precautions

1. Before repairing, be sure to discharge the large electrolytic capacitors across a resistor of about 100 ohms/1 watt.

■ When disassembling

1. When replacing a power transistor or IC, be sure to apply silicone grease to the section of a new transistor or IC which is in close contact with the heatsink, then mount it.
2. Copper screws (red) are used for improved sound quality. Be sure to use specified screws.
3. When removing or stretching wires on the P. C. Board, be sure to restore them to their original routing as far as possible.
4. When connecting a remote switch, insert it from above as shown in Fig. 2. In this case, press it in sufficiently in order to prevent it from floating during operation.

Features

- **High S/N ratio achieved through the world's first employment of Gm selector and Gm volume control**
Combined use of the Gm selector and the Gm control Volume enables the practical noise level to be extremely reduced, thus permitting extended dynamic range relative to low output level and making effective use of the merits of a digital system even at micro output level.
- **Dynamic "Super-A" amplifier with Gm driver**
The dynamic "Super-A" amplifier greatly improves the dynamic characteristics regardless of the effect of the load because of current-voltage conversion amplification. The digital sound is played back at high fidelity with an exciting, lively feel.
- **Various I/O terminals for diversified program sources**
DAD only input terminals, TAPE and other terminals are independently attached to the rear or front panel, thus meeting diversified program source requirements.
- **PHONO (MC/MM), DAD, TUNER, AUX, TAPE-1/2 and TAPE-3 jacks on the rear and front panels**
- **High power from large capacity power supply: 120W + 120W**
- **Simple 2-amplifier configuration**
High-gain MC/MM EQ amplifier + high-gain power amplifier.

1. Specifications

OVERALL CHARACTERISTICS

	120 watts per channel, min. RMS, both channels driven, into 8 ohms from 20 Hz to 20 kHz, with no more than 0.003% total harmonic distortion.
	125 watts per channel, min. RMS, both channels driven, into 8 ohms at 1 kHz with no more than 0.0005% total harmonic distortion.
	130 watts per channel, min. RMS, both channels driven, into 8 ohms at 1 kHz with no more than 0.7% total harmonic distortion.
Total harmonic distortion	
DAD, IN → SP. OUT	: 0.003% (20 Hz – 20 kHz, 8 ohms) at 120 watts
PHONO (MM) IN → SP. OUT	
	: 0.007% (20 Hz – 20 kHz, 8 ohms) at 120 watts at VOLUME –30 dB
Intermodulation distortion	
DAD, IN → SP. OUT	: 0.001% (60 Hz: 7 kHz = 4 : 1, 8 ohms) at 120 watts
Power band width	
DAD, IN → SP. OUT	: 7 Hz – 60 kHz (IHF, 0.05%, 8 ohms both channels driven)
Frequency response	
DAD, TAPE-1, 2, 3, AUX, TUNER	: 3 Hz – 100 kHz +0, –3 dB (8 ohms)
Damping factor	: 80 (1 kHz, 8 ohms)
Input terminals	
Input sensitivity/impedance (1 kHz)	
PHONO (MM)	: 2.5 mV/47 kohms
PHONO (MC)	: 200 μ V/100 ohms
DAD, TAPE-1, 2, 3, AUX, TUNER	: 200 mV/39 kohms

Signal to noise ratio

PHONO (MM)	: 85 dB/80 dB
PHONO (MC)	: 69 dB (250 μ V input)
TUNER, DAD	: 109 dB/85 dB
AUX	: 109 dB/85 dB
TAPE-1, 2, 3 (‘66 IHF/DIN)	: 109 dB/85 dB
PHONO (MM)	: 83 dB (Rec Out)
PHONO (MC)	: 75 dB (Rec Out)
TUNER	: 91 dB (Speaker Out)
AUX	: 91 dB (Speaker Out)
TAPE-1, 2, 3 (‘78 IHF)	: 91 dB (Speaker Out)
Tone controls	
	: TREBLE: \pm 8 dB (10 kHz) BASS : \pm 8 dB (100 Hz)
Subsonic filter	: 18 Hz (–6 dB/oct)
Loudness control	: 100 Hz, +4 dB
Muting level	: –20 dB

EQUALIZER

PHONO overload capacity	
PHONO (MM)	: 150 mV (1 kHz, 0.002% THD)
PHONO (MC)	: 11 mV (1 kHz, 0.003% THD)
PHONO RIAA deviation	
PHONO (MM)	: \pm 0.2 dB (20 Hz – 20 kHz)
PHONO (MC)	: same as above
Total harmonic distortion	
PHONO (MM)	: 0.002% (at 7V output, 20 Hz – 20 kHz)
PHONO (MC)	: 0.008% (at 7V output, 20 Hz – 20 kHz)

GENERAL

Power source	: See page 3
Power consumption	: See page 3
Dimensions	: 149 (H) \times 435 (W) \times 406 (D) mm 5-7/8" (H) \times 17-1/8" (W) \times 16" (D)
Weight (net)	: 12.5 kg (27.5 lbs)

Design and specifications subject to change without notice.

IHF: Initials of the Institute of High Fidelity in the U.S.A.

Power Specifications

Areas	Line voltage & frequency	Power consumption
U.S.A.	AC 120V~, 60 Hz	410 watts, 550 VA
Canada		
Continental Europe	AC 110/120/220/240V~ selectable, 50/60 Hz	250 watts
U.K.		
Australia		
Other Areas	AC 110/120/220/240V~, selectable, 50/60 Hz	250 watts

2. Servicing Method For AWG # 20 Wires With Clamping Terminals

- 1) Application objective ➡ Confirmation of safety
Used to prevent breakage/disconnection troubles of primary and secondary wires within P. C. Boards (or between P. C. Boards). Even when wire breakage/disconnection has actually occurred, a safe air-gap distance between the primary wire and the secondary wire/possibly contacting metal surface can be maintained because the terminal retains the wire sheathing.
- 2) Type of wire used
① 1015 AWG- # 20 (single-coated)
② 1672 AWG- # 20 (double-coated)
- 3) Servicing precautions
① The structural design of this terminal causes its catch to hook onto the P. C. Board, preventing the wire from being easily pulled out. As shown in the figure, use cutting pliers or a similar tool to cut off the ends of the terminal and wire; then remove the remaining terminal clip by melting the soldering.

2. Insert the wire until its sheathing contacts section "A" of the terminal and pressure-fit the terminal clamp at three sections of ①, ② and ③ (section ③ is especially important to assure safety. Exercise particular care to achieve secure clamping).

Fig. 4

Fig. 3

- ③ Part No., and name
Parts No. : 5298T
Name : CRIMP PIN

Fig. 5

- ② Prior to soldering the wire onto the P. C. Board, confirm safety by pressure-fitting the terminal to the wire by observing the following procedures.
1. Strip off the wire 5 ~ 6 mm from its end.

3. Names and Functions of Controls

1 POWER switch

Press in to turn the power of the unit ON. The POWER indicator placed just above the switch will light. Press again to turn OFF.

2 PHONES jack

Plug the headphones into the jack for private listening.

Note: Plugging in the headphones does not switch off the speaker sound. To listen only through the headphones, set the SPEAKERS switch to OFF.

3 REC SELECTOR

TUNER: Set to this position to listen to another program source while recording a broadcast program.

OFF: Set to this position when not recording or dubbing.

SOURCE: Set to this position to record from source connected to the PHONO, TUNER, DAD, or AUX terminals.

S ▶ 1 ▶ 2/3: Set to this position when dubbing from the tape deck connected to the TAPE-1 terminals to the tape deck connected to the TAPE-2 or -3 terminals, or when recording from the source selected by a source selector button to the tape deck connected to the TAPE-1 terminals.

2 ▶ 1: Set to this position when dubbing from the tape deck connected to the TAPE-2 terminals to the tape deck connected to the TAPE-1 terminals.

3 ▶ 1: Set to this position when dubbing from the tape deck connected to the TAPE-3 terminals to the tape deck connected to the TAPE-1 terminals.

4 TAPE SELECTOR

2: Set to this position to listen to the tape deck connected to the TAPE-2 terminals.

1: Set to this position to listen to the tape deck connected to the TAPE-1 terminals.

3: Set to this position to listen to the tape deck connected to the TAPE-3 terminals.

5 TAPE MONITOR switch

Press in to listen to a tape deck. The indicator located just above the switch will light. In this case, select the required tape deck with the TAPE SELECTOR.

Notes: ● When the indicator is lit, it is not possible to listen to records or radio broadcasts. For this purpose, press this switch again to switch off the indicator.

- When monitoring the recording on the 3-head tape deck (when recording while checking the recording condition upon playback of recorded sounds), press in this switch to light the indicator.

Fig. 1

6 SPEAKERS switch

OFF: Set to this position to switch off the speaker sound for listening through the headphones.

1: Set to this position to listen to the speakers connected to SPEAKERS terminals 1.

2: Set to this position to listen to the speakers connected to SPEAKERS terminals 2.

1 + 2: Set to this position to listen to both speaker systems simultaneously.

Note: Use the speakers with impedance of 8 ohms or more (16 ohms if the 1 + 2 position is used) at the rated speaker impedance of this amplifier is 8 ohms (16 ohms when the 1 + 2 position is used). Speakers with an impedance down to 4 ohms (8 ohms when the 1 + 2 position is used) may be used, in which case the temperature rise of cabinet may not satisfy BS 415 or IEC 65.

Be sure to provide good ventilation, especially when speakers with an impedance of 4 ohms (8 ohms when the 1 + 2 position is used) are used.

7 BASS control

Turn to the right to boost bass response and to the left to decrease bass response.

8 TREBLE control

Turn to the right to boost treble response and to the left to decrease treble response.

9 SUBSONIC switch

ON (■): Press in (■) to eliminate the ultra-low frequency noise when you feel it is annoying.

OFF (□): Normally, set to this position.

10 TONE switch

ON: Press in to ON when adjusting the tone with the BASS and TREBLE controls. The indicators located just above these controls will light.

OFF: Press again to OFF to hear the standard sound (with flat response).

Fig. 7

1 LOUDNESS switch

ON (■): Press in (■) to listen at low volume. You can enjoy powerful play even at low volume.

OFF (□): Press again (□) to eliminate the loudness effect.

2 Source selector switches

Press the switch corresponding to the required source. The indicator located just above this button will light.

DAD: Press this switch to listen to the DAD (digital source).

PHONO: Press this switch to listen to records.

TUNER: Press this switch to listen to radio broadcasts.

AUX: Press this switch to listen to the source connected to the AUX terminals.

3 MUTING switch

Press to mute the sound (-20 dB); the right MUTING indicator will light. Use this button when answering the telephone, for example. Pressing again returns the volume level to that adjusted with the Gm VOLUME control.

4 GM SELECTOR

Setting the Gm selector to -6 dB divides the volume at 0 dB by 4 while setting it to -12 dB divides it by 16. As the Gm selector is turned from 0 dB to -6 dB and -12 dB, residual noise becomes progressively less. Use the Gm selector together with the Gm VOLUME control.

5 Protection indicator

The indicator flickers for a few seconds immediately after the unit power is turned ON. However, when operation becomes stable, the condition of the indicator changes from flickering to permanently lit.

In addition, while the indicator is flickering, no sound is emitted from the speakers.

When the protection circuit works during operation, the condition of the indicator changes from lit to flickering to indicate there is an abnormality in the unit.

At this time, turn OFF the power, then remove the case (speaker cord short, etc.) so that the protection circuit is released.

16 Gm SELECTOR switch

The residual noise in the unit is reduced in the order of "0 dB", "-6 dB" and "-12 dB" positions.

Use this switch at an appropriate volume in combination with the Gm VOLUME control.

0 dB: Set to this position when listening at high volume.

-6 dB: Set to this position when listening at medium volume. In this position, the volume is about 1/4 that at "0 dB" position.

-12 dB: Set to this position when listening at low volume. In this position, the volume is about 1/16 that at "0 dB" position.

17 Gm VOLUME control

Controls the volume to speakers or headphones.

In addition, the scale indicates in dB the amount of attenuation with the reference of the maximum volume.

■ Gm VOLUME control

This control system varies the amplification degree differently from a conventional attenuation system. Thus, even when the volume is decreased, high S/N ratio and low distortion rate are obtained with no increase in residual noise.

18 BALANCE control

Balances the volume between the left and right speaker sounds. Usually, set it to the center click position.

19 MODE switch

REVERSE: Set to this position when playing back with the L-ch and R-ch signals reversed.

NORMAL: Normally, set to this position.

MONO L + R: Set to this position when playing back the mixed L- and R-channel signal from both channels.

MONO L: Set to this position when playing back only the L-channel signal from both channels.

MONO R: Set to this position when playing back only the R-channel signal from both channels.

20 MC. MM

MC (moving coil) (■):

Press in (■) when using an MC cartridge whose output is less than 0.5 mV.

MM (moving magnet) (□):

Set to this position when using an MM cartridge or a high-output MC cartridge whose output is more than 0.5 mV.

4. Description of Technology

■ Gm Volume control circuit

In a stereo amplifier, the VR has the important function of determining the playback sound volume.

In a conventional system, the volume is adjusted by attenuating by a VR the level of the input signal applied to the amplifier with a specified voltage gain as shown in Fig. 8. In this system, when the VR is set to the max. volume position, the input signal is applied directly to the amplifier, permitting favorable response. However, although the level of the input signal to the amplifier lowers as the volume is decreased by the VR, the level of the noise emitted from the amplifier does not change and the S/N ratio is degraded with increase of the VR noise as the volume is decreased.

In the Gm volume control circuit used in this unit, the volume is adjusted by varying the voltage gain of the amplifier to remove the drawback in a conventional system.

As shown in Fig. 9, the Gm volume control circuit has a circuit configuration in which the I/O terminals (A) and (B) for the bridged transistors (Q1 - 4) and constant current circuits (C.C.1 - 2) are placed opposite each other. The input signal to terminal (A), for which the voltages almost equal to its signal voltage appear at the emitters of Q1 and Q2, is output in the form of current from the

Fig. 8

collectors of Q1 and Q2 and then output to r from the collectors of cascade connected Q3 and Q4. Voltage gain A_v in this circuit is expressed as:

$$A_v \left(= \frac{e_o}{e_i} \right) = - \frac{r}{R_1 + (R_v - r)} \quad (1)$$

When r changes from 0 to R_v , the values in the denominator and numerator of expression (1) vary according to the VR set position, i.e. the gain of the amplifier varies. Thus, the greatest dynamic range and the best S/N ratio are obtained at all times.

■ Gm volume control circuit used in this unit

Fig. 9

■ Gm selector circuit

The Gm volume control circuit requires "phase inversion between I/O voltages" and "power amplification for driving speakers". Accordingly, in this unit, an inversion type main amplifier is connected after the Gm volume control circuit.

In the circuit shown in Fig. 10, the voltage gain is adjusted by changing the input resistance by selecting a suitable one from input resistors R259, R261 and R251 (0 dB, -6 dB and -12 dB). Point A in Fig. 10 is the imaginary ground point. Thus, the input signal voltage is converted into a current proportional to the reciprocal number of the input resistance value. Then, it is converted into a voltage with feedback impedance (Z) again. In this manner, voltage amplification is performed.

In this unit, as the voltage gain of the main amplifier is controlled in the above manner, the characteristics are improved as follows:

- (1) Residual noise is reduced.
- (2) The basic characteristics are upgraded since the excessive gain is turned to the increase of the NFB amount.

Fig. 11 shows the noise characteristic in the unit. It can be seen that the S/N ratio is improved more than 20 dB at a practical VR position as compared with conventional systems.

Fig. 10

Fig. 11

5. Removal Procedures

5-(1) Tone P.C. Board section

Remove 4 screws (2 on each cover side) and 3 screws on the rear panel. Then, remove the metal cover.

1. Remove 3 screws from the upper part of the front panel and 3 screws from the lower part.
2. Remove the front panel. Pull out the volume knob, and remove the nut (Fig. 12).

Fig. 12

3. Pull out the treble and bass knobs and remove their nuts (Fig. 13).
4. Remove the screws on both sides of the tone switch and remove the tone P.C. Board (Fig. 13).

Fig. 13

Fig. 14

5-(2) Gm Selector knob replacement

1. Remove the front panel (Refer to 5-1.).
2. Peel off the bond fixing 2 speed nuts inside the front panel.

Fig. 15

5-(3) Power Transistor Section

1. Remove 5 screws from the bottom cover.
2. Remove the bottom cover (Fig. 16).

Fig. 16

NOTES: Install in the reverse order to removal.

When installing the front panel;

- ① Set each L.E.D. in the proper position.
- ② Position the arm horizontally as shown in Fig. 14, and install the master volume knob so that its pointer indicates the -12 dB position.

3. Holding the Gm Selector knob assembly on the front panel to prevent it coming apart (ball bearing, etc.), remove 3 speed nuts and then the Gm Selector knob (Fig. 15).

6. Adjustment Procedures

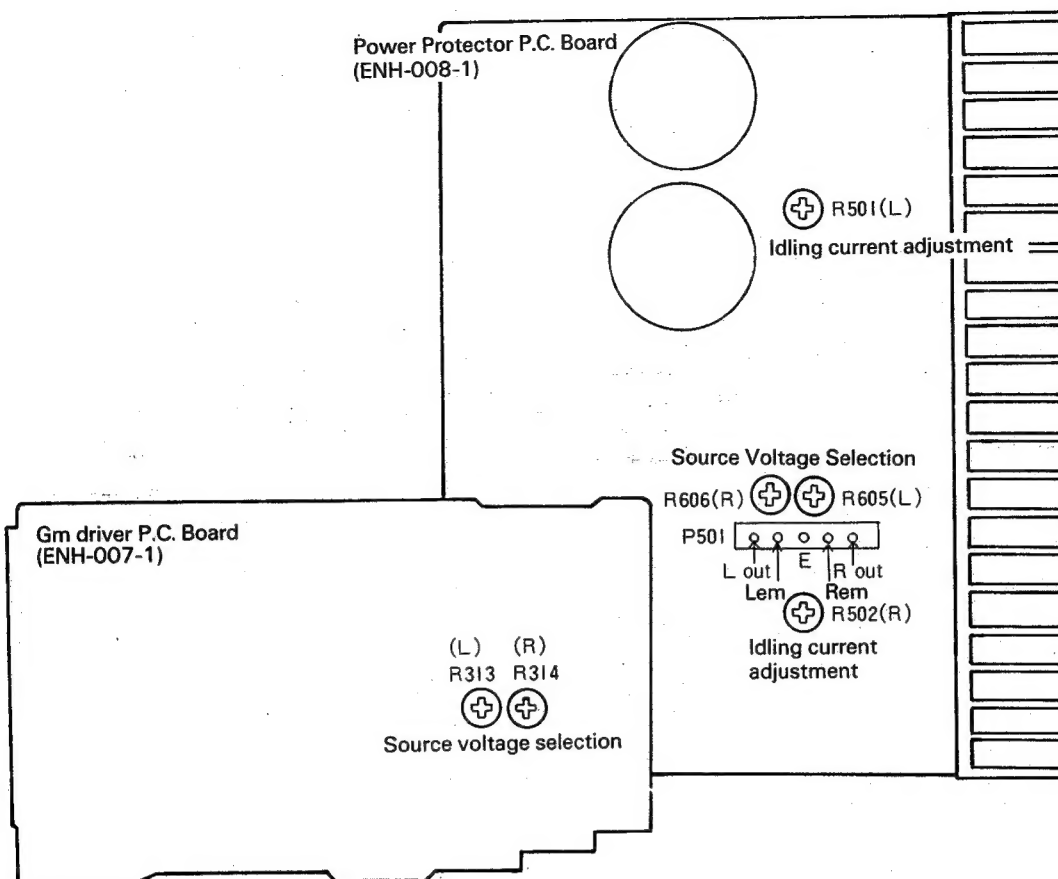

Fig. 17

■ Idling current adjustment

- (1) Before turning ON the power, turn the semi-fixed resistors (R501 for L channel and R502 for R channel) on the power amplifier P.C. Board fully counterclockwise.
- (2) After turning ON the power, adjust the voltages between L out (–) and Lem (+) and between R out (–) and Rem (+) in P501 with semi-fixed resistors R501 and R502.
 - { When adjusting 1 minute after power ON: 5 mV
 - { When adjusting 10 minutes after power ON: 11 mV

■ Center voltage adjustment

Adjust the voltages between the following terminals to 0 ± 1 mV with R313 (L channel) and R314 (R channel).

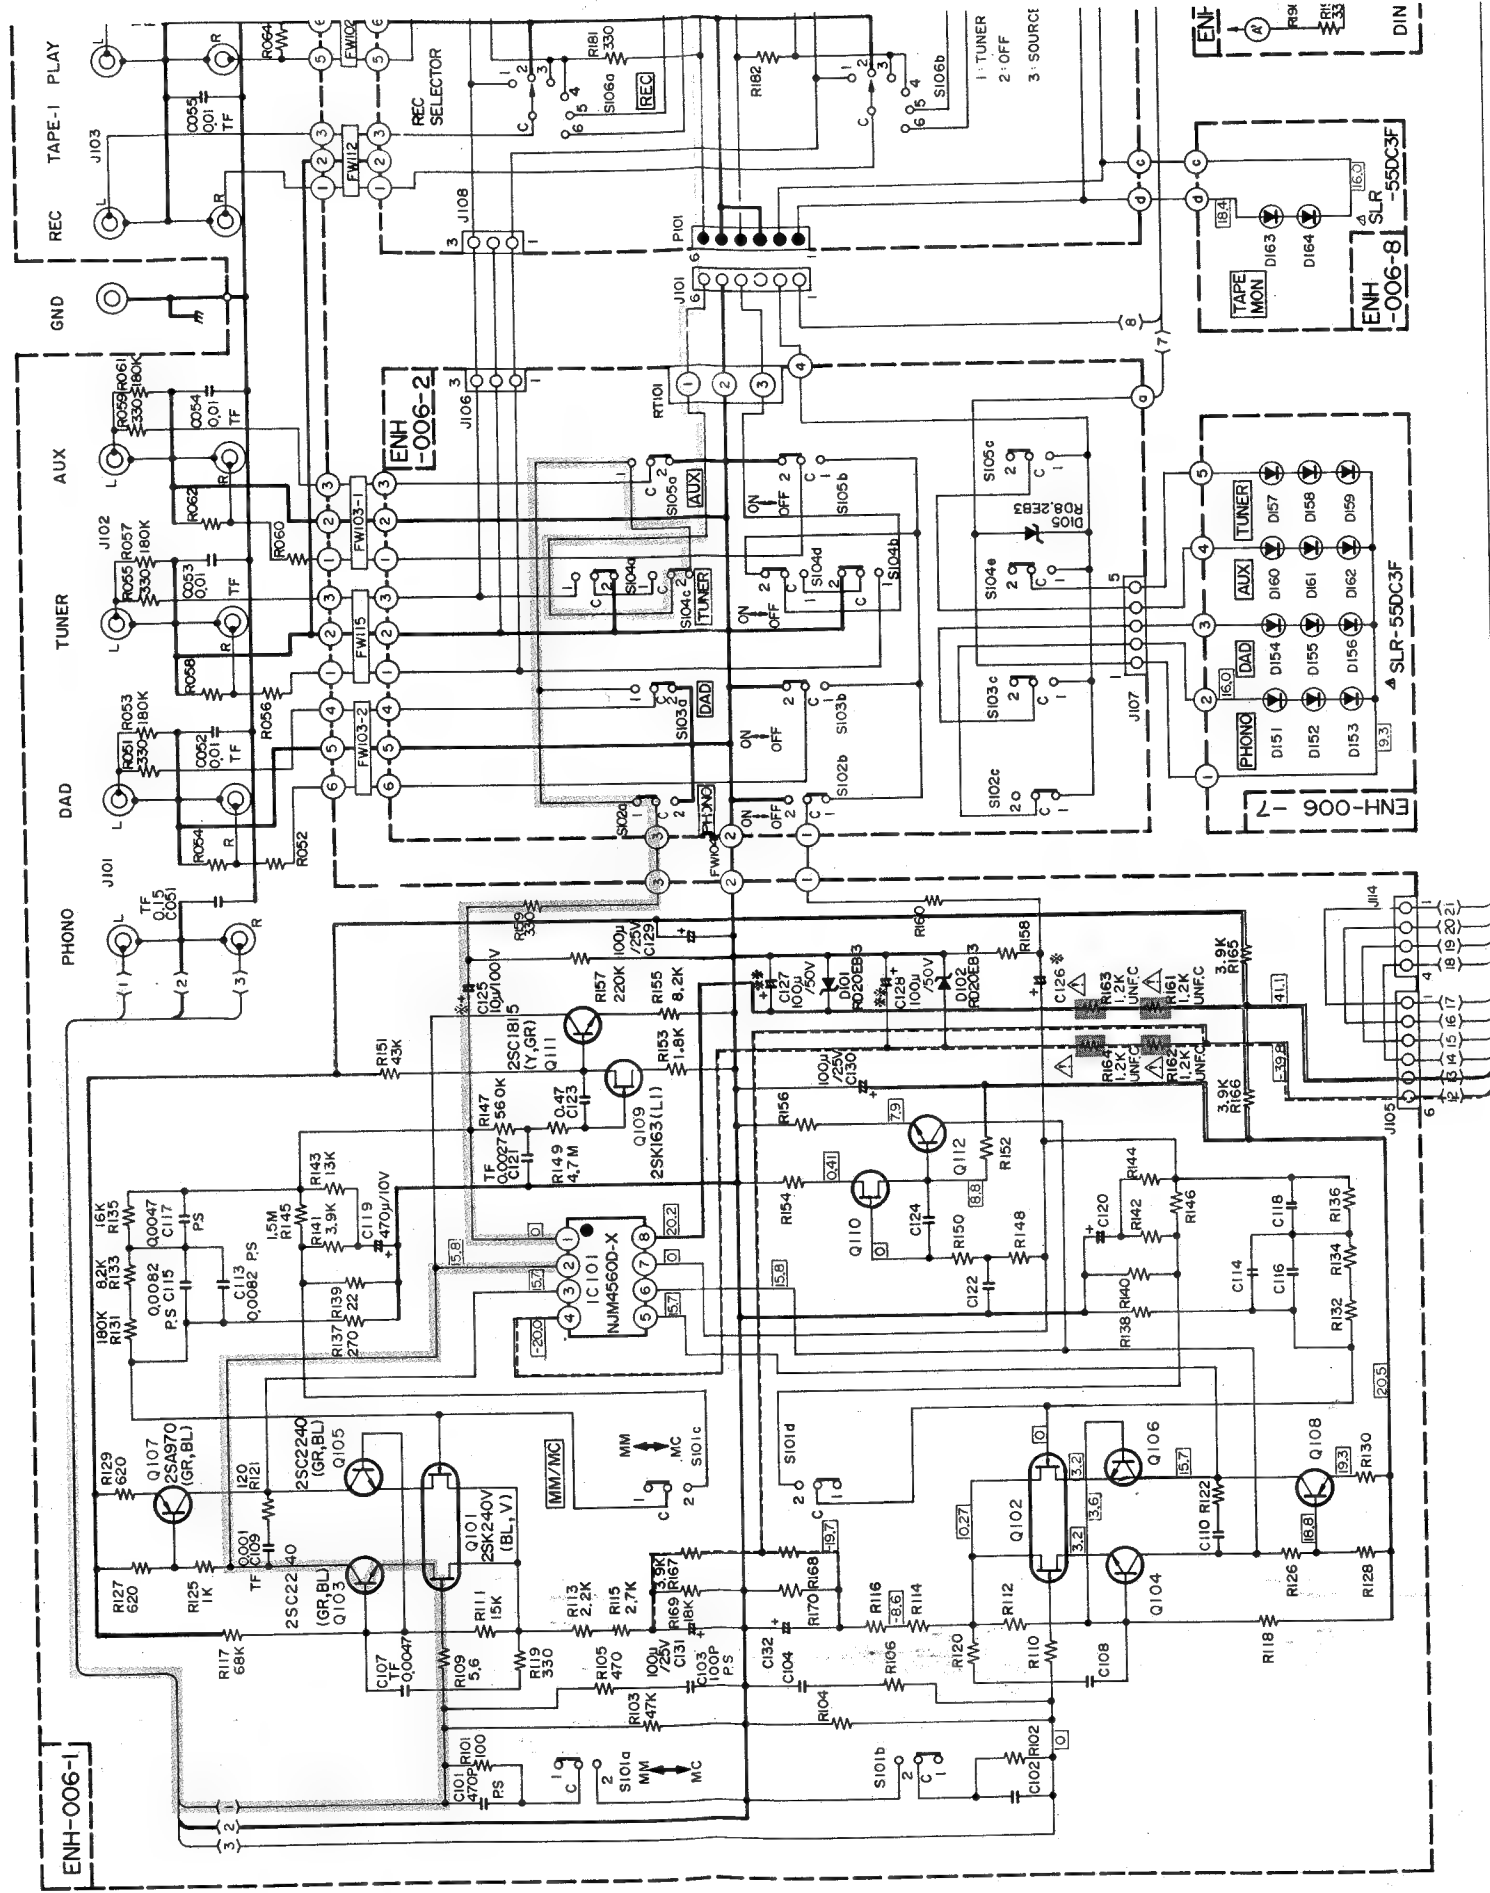

- { E (ground) – L out in P501: R313
- { E (ground) – R out in P501: R314

■ Voltage selector circuit adjustment

- (1) Before turning ON the power, turn the semi-fixed resistors (R605 for L channel and R606 for R channel) on the power amplifier P.C. Board fully counterclockwise.
- (2) After turning ON the power, apply a 20 Hz sine wave to either the L or R channel input, connect a 7-ohm dummy load (distributed by JVC Stereo Division) as the speaker load, and adjust the Gm volume control so that 34V output is obtained. At this time, decrease the input level of the other channel by the BALANCE control.
- (3) Slowly turn the semi-fixed resistor (R605 for L channel or R606 for R channel) clockwise and stop it at a position where the output waveform begins to be clipped on the oscilloscope.
- (4) Change the load from 7 ohms to 8 ohms and check the output waveform is not clipped. This adjustment is performed for both channels, separately.

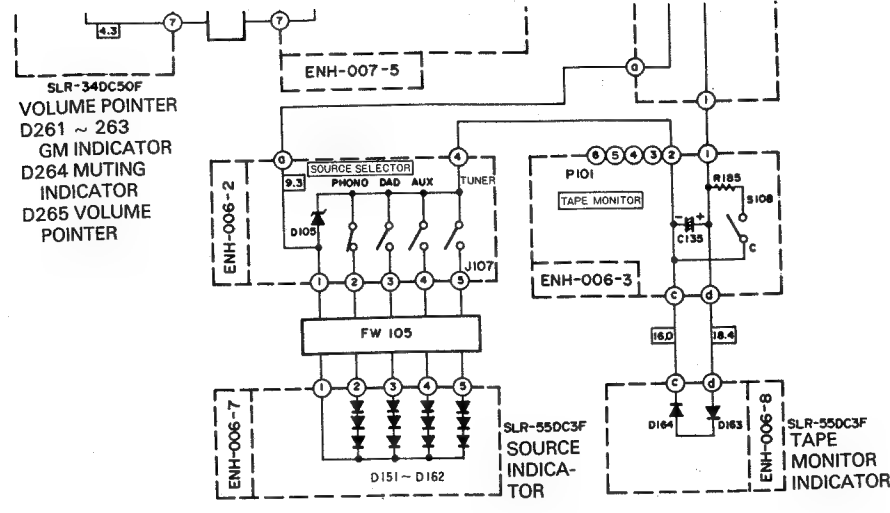

Note: When performing measurements in these adjustments, be sure to disconnect the probe and enclosure (metal case) of the measuring instrument from the ground of the amplifier unit (A-X900) and the ground of any other measuring instrument so that measurements can be made with the instrument electrically independent.

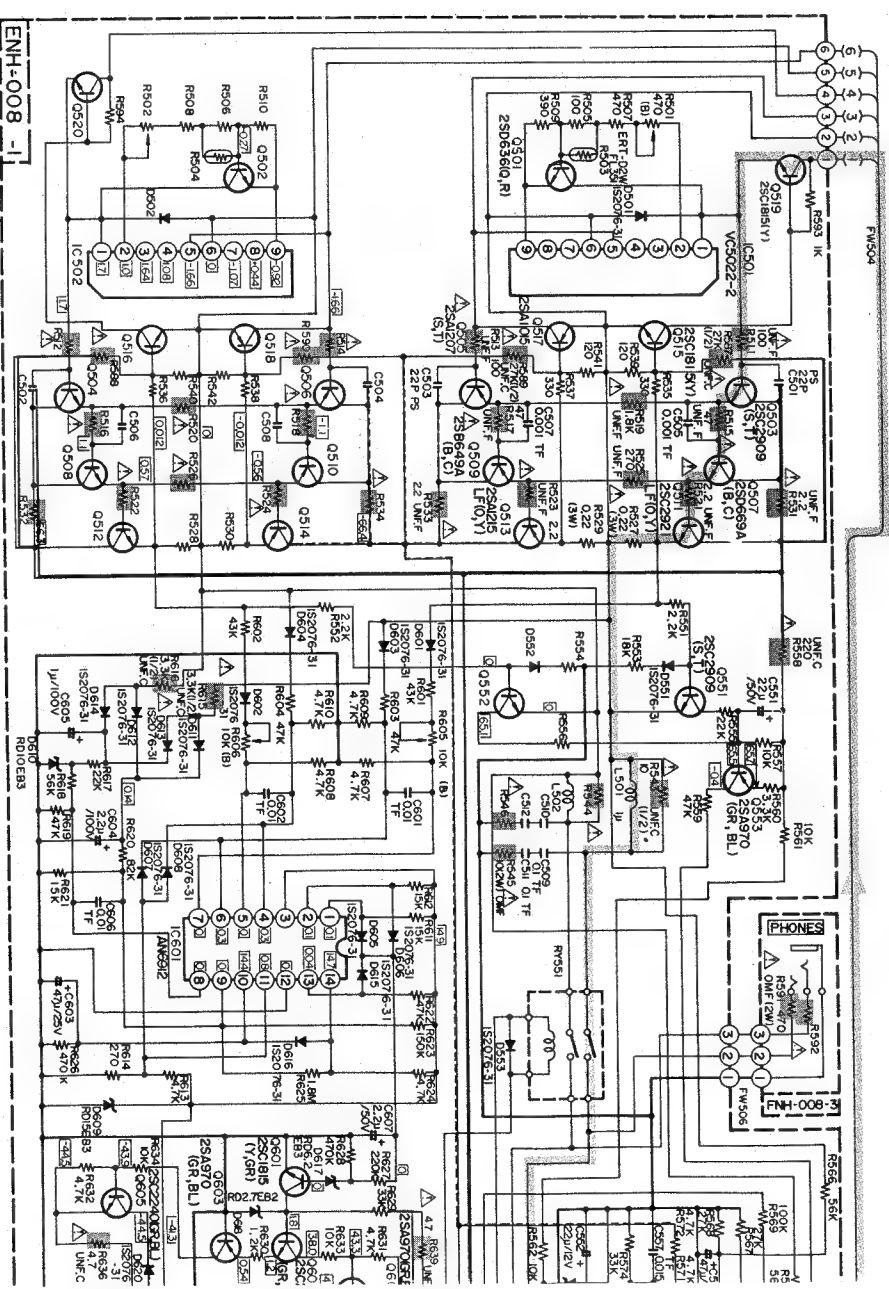

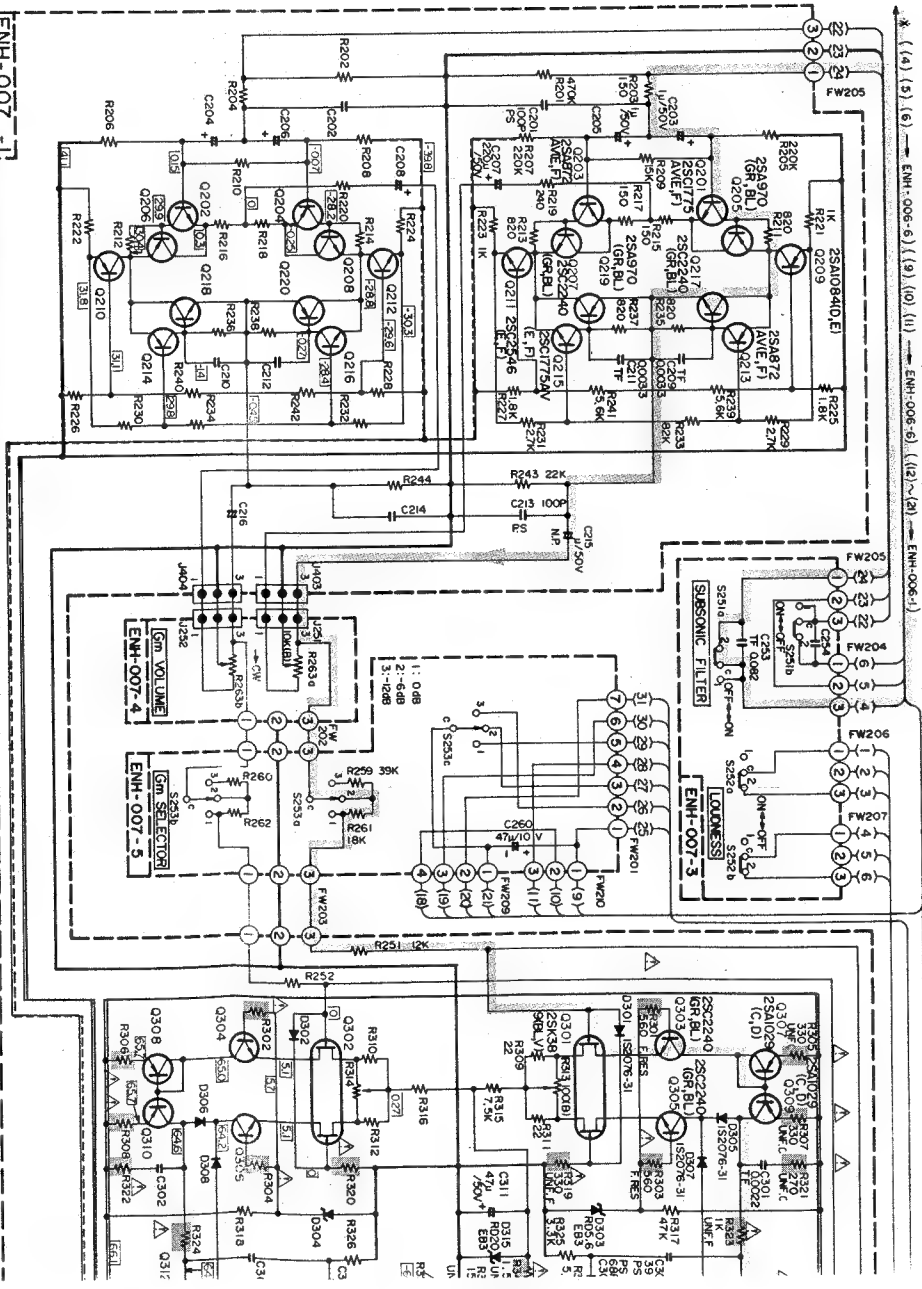

7. A-X900B Schematic Diagram

Note:

1. _____ indicates B (+).
 2. _____ indicates B (-).
 3.  indicates the signal path.
 4. The voltage measured by a multi-meter (inner resistance: 20 k Ω /V) at non-signal condition is shown in the following form.
- Example: 0.3 (Unit: V)
5. In the transistor parts and the measured voltage figures, only one channel is indicated when left and right channels are identical.
 6. The parts marked Δ () are important for safety reasons.
 7. As this diagram gives only reference circuits, the circuit and the circuit constant are subject to change without notice due to technical improvement.
 8. Indicator connection is shown in the right-hand figure.

(E) (A) (BS) (E) FOR EUROPE : ~ 220V, 50Hz
(A) FOR AUSTRALIA : ~ 240V, 50Hz
(BS) FOR UK : ~ 240V, 50Hz

(G) FOR WEST GERMANY : 220V, 50Hz

Fig. 1

3. Printed Circuit Board Ass'y and Parts List

3-(1) ENH-006 □ Equalizer P. C. Board Ass'y

Note: ENH-006 □ varies according to the areas employed. See note (1) when placing an order.

Note (1)

Designated Areas	P.C. Board Ass'y
U.S.A., Canada	ENH-006 D
West Germany	ENH-006 C
Europe, Australia U.S. Military Market U.K., Other Countries	ENH-006 B

Note (2)

The symbols (赤、黒、白etc.) on P.C. Board surface are factory process only.

Fig. 2

Each Individual P.C. Board Location

- ① ENH-006-1 Equalizer P. C. Board Ass'y
- ② ENH-006-2 Source Selector P. C. Board Ass'y
- ③ ENH-006-3 Tape Monitor P. C. Board Ass'y
- ④ ENH-006-4 Tape Pin Jack P. C. Board Ass'y
- ⑤ ENH-006-5 Mode Balance P. C. Board Ass'y
- ⑥ ENH-006-6 Muting P. C. Board Ass'y
- ⑦ ENH-006-7 Source Indicator P. C. Board Ass'y
- ⑧ ENH-006-8 Tape Indicator P. C. Board Ass'y
- ⑨ ENH-006-9 DIN Connector P.C. Board Ass'y
